E-Learning With Code Compiler

Abstract:

The rapid growth of online education has created a demand for interactive and practical learning platforms that go beyond traditional video-based teaching. This project proposes the development of an **E-Learning Platform with an Integrated Code Compiler using the MERN Stack (MongoDB, Express.js, React.js, and Node.js)** to provide a comprehensive and hands-on learning experience for students and educators. The system enables learners to access structured courses, video lectures, notes, and assignments, while simultaneously practicing programming through a built-in online code compiler.

The platform supports multiple user roles such as **Admin, Instructor, and Student**, each with dedicated dashboards and functionalities. Instructors can create courses, upload learning materials, assign coding tasks, and evaluate student performance. Students can write, compile, and execute code in real time within the browser without requiring any local development environment, allowing instant feedback and improved coding skills. The compiler supports multiple programming languages and securely executes code on the server.

By leveraging the MERN stack, the system ensures high performance, scalability, and responsiveness, along with secure authentication and efficient data management. The proposed platform bridges the gap between theoretical learning and practical implementation, making it suitable for academic institutions, training centers, and self-learning environments. This solution enhances learner engagement, improves programming proficiency, and provides an effective digital learning ecosystem.
