

Online Notice Board With Automatic Timetable Generator

Abstract:

The Online Notice Board with Automatic Timetable Generator Management System is a web-based application developed using the MERN stack, which includes MongoDB, Express.js, React.js, and Node.js. The primary objective of this system is to provide an efficient digital platform for managing and displaying institutional notices while automatically generating academic timetables in a structured and error-free manner.

The system enables administrators to create, update, and publish notices that can be accessed by students and staff in real time. It eliminates the need for physical notice boards and ensures faster communication, improved accessibility, and better information management within educational institutions.

An automatic timetable generator is integrated to simplify schedule creation by considering predefined constraints such as subjects, faculty availability, classrooms, and time slots. This feature reduces manual effort, avoids conflicts, and ensures optimal utilization of academic resources.

MongoDB is used for secure and scalable data storage, while Express.js and Node.js handle backend processing and system logic. The frontend, developed using React.js, provides a responsive and user-friendly interface. Overall, this system enhances communication efficiency, minimizes administrative workload, and offers a reliable and scalable solution for modern educational management.

The system supports centralized data management and secure access control, ensuring that only authorized users can manage notices and generate timetables. By automating routine administrative tasks and providing real-time updates, the application improves operational efficiency and delivers a smart, technology-driven solution for educational institutions.
